Re: Schlebach Quadro Product Review

At Metalforming we have created a testing program that is second to none for portable roll forming machines. We have prepared this application manual to help you in a myriad of ways: summarization of testing results, clarification of slopes and drops, recommended material specifications, recommended installation design, a baseline marketing tool and of course actual test results for each panel for use with architects and building commissions.

The ASTM tests require no follow-up. They are in simply empirical test results for use by engineers, contractors and architects.

The Dade County test results are owned by a Company called Schlebach users of America. This group's members are those owners of Quadros who reside in Florida. However, anyone can use the test results as empirical data for use by engineers.

Texas Windstorm testing requires that you take the test results that we have completed and apply to the Texas Department of insurance for certification.

The tests that we have completed with Underwriter's Laboratories are a main component of the knowledge of our panels.

Underwriters Laboratories offers a follow-up program for testing of your machine and panels that will allow you to actually get your name in the UL directory under the Metalforming, Inc. construction number. This program is not affiliated or sponsored by Metalforming Inc. We have, however, included a letter of reference that allows you to use that data that we have paid for. If you chose to do this you should contact Alpesh Patel at UL at 847-272-8800.

Sincerely,

Frank Callis
